

MAR - 4 1997

**510(k) Summary - K963257**

The Arrow Peripherally Inserted Midline Catheter is made of polyurethane material that is similar to our existing PIC catheters. The midline catheter will be available in both single and double lumen configurations, several trimmable and non-trimmable lengths, and the option of inserting with or without a placement wire.

The device has comparable technological characteristics to several predicate devices. For the purposes of this submission, the Arrow Midline Catheter is compared to the Menlo Care Landmark Catheter in terms of the following nonclinical test results:

- Flow rate test
- Priming volume test
- Flex modulus test
- Burst pressure test
- Tensile strength test

The device also meets all biocompatibility requirements.
